- ▶ Input fills **fixed-size tape**
- ▶ Input may be **modified**
- ▶ Tape alphabet **equals** input alphabet

Our Model of “Absolutely No Space Overhead”

tape

1	1	1	0	0	1	0	1
---	---	---	---	---	---	---	---

Turing machine

Characteristics

- ▶ Input fills **fixed-size tape**
- ▶ Input may be **modified**
- ▶ Tape alphabet **equals** input alphabet

Our Model of “Absolutely No Space Overhead”

Turing machine

Intuition

- ▶ Tape is used like a RAM module.

Definition of Overhead-Free Computations

Definition

A Turing machine is **overhead-free** if

- ▶ it has only a single tape,
- ▶ writes only on input cells,
- ▶ writes only symbols drawn from the input alphabet.

Overhead-Free Computation Complexity Classes

Relationships among Overhead-Free Computation Classes

A Review of Linear Grammars

Definition

A grammar is **linear** if it is context-free and there is only one nonterminal per right-hand side.

Example

$$G_1: S \rightarrow 00S0 \mid 1.$$

$$G_2: S \rightarrow 0S10 \mid 0.$$

A Review of Linear Grammars

Definition

A grammar is **linear** if it is context-free and there is only one nonterminal per right-hand side.

Example

$$G_1: S \rightarrow 00S0 \mid 1.$$

$$G_2: S \rightarrow 0S10 \mid 0.$$

Definition

A grammar is **deterministic** if
“there is always only one rule that can be applied.”

Example

G_1 is deterministic.

G_2 is not deterministic.

Deterministic Linear Languages Can Be Accepted in an Overhead-Free Way

Theorem

Every deterministic linear language is in DOF_{poly} .

Continued Review of Linear Grammars

Definition

A language is **metilinear** if it is the concatenation of linear languages.

Continued Review of Linear Grammars

Definition

A language is **metilinear** if it is the concatenation of linear languages.

Example

$\text{TRIPLE-PALINDROME} = \{uvw \mid u, v, \text{ and } w \text{ are palindromes}\}.$

Metalinear Languages Can Be Accepted in an Overhead-Free Way

Theorem

Every metalinear language is in NOF_{poly} .

Relationships among Overhead-Free Computation Classes

Definition of Almost-Overhead-Free Computations

Definition

A Turing machine is **almost-overhead-free** if

- ▶ it has only a single tape,

Definition of Almost-Overhead-Free Computations

Definition

A Turing machine is **almost-overhead-free** if

- ▶ it has only a single tape,
- ▶ writes only on input cells,

Definition of Almost-Overhead-Free Computations

Definition

A Turing machine is **almost-overhead-free** if

- ▶ it has only a single tape,
- ▶ writes only on input cells,
- ▶ writes only symbols drawn from the input alphabet
plus one special symbol.

Context-Free Languages with a Forbidden Subword Can Be Accepted in an Overhead-Free Way

Theorem

Let L be a context-free language with a forbidden word.

Then $L \in \text{NOF}_{\text{poly}}$.

The proof is based on the fact that every context-free language can be accepted by a nondeterministic almost-overhead-free machine in polynomial time.

Relationships among Overhead-Free Computation Classes

Some PSPACE-complete Languages Can Be Accepted in an Overhead-Free Way

Theorem

DOF contains languages that are complete for PSPACE.

Go to proof details.

Limitations of Overhead-Free Computation

Linear Space is Strictly More Powerful

Some Context-Sensitive Languages Cannot be Accepted in an Overhead-Free Way

Theorem

$\text{DOF} \subsetneq \text{DLINSPACE}$.

Theorem

$\text{NOF} \subsetneq \text{NLINSPACE}$.

The proofs are based on old diagonalisations due to Feldman, Owings, and Seiferas.

Relationships among Overhead-Free Computation Classes

Candidates for Languages that Cannot be Accepted in an Overhead-Free Way

Conjecture

DOUBLE-PALINDROMES \notin DOF.

Conjecture

$\{ww \mid w \in \{0, 1\}^*\} \notin$ NOF.

Proving the first conjecture would show $\text{DOF} \subsetneq \text{NOF}$.

Summary

- ▶ Overhead-free computation is a more faithful **model of fixed-size memory**.
- ▶ Overhead-free computation is **less powerful** than linear space.
- ▶ **Many** context-free languages can be accepted by overhead-free machines.
- ▶ We conjecture that **all** context-free languages are in NOF_{poly} .
- ▶ Our results can be seen as new results on the power of **linear bounded automata with fixed alphabet** size.

Appendix

Overhead Freeness and Completeness Improvements for Context-Free Languages

Overhead-Free Languages can be PSPACE-Complete

Theorem

DOF contains languages that are complete for PSPACE.

Proof.

- ▶ Let $A \in \text{DLINSPACE}$ be PSPACE-complete.
Such languages are known to exist.
- ▶ Let M be a linear space machine that accepts $A \subseteq \{0, 1\}^*$
with tape alphabet Γ .
- ▶ Let $h: \Gamma \rightarrow \{0, 1\}^*$ be an isometric, injective homomorphism.
- ▶ Then $h(L)$ is in DOF and it is PSPACE-complete.
