Turing machine

Intuition

 Tape is used like a RAM module.

Definition of Overhead-Free Computations

Definition

A Turing machine is overhead-free if

- it has only a single tape,
- writes only on input cells,
- writes only symbols drawn from the input alphabet.

Definition

A language $L \subseteq \Sigma^*$ is in

DOF if L is accepted by a deterministic overhead-free machine with input alphabet Σ ,

 $\mathsf{DOF}_{\mathsf{poly}}$ if L is accepted by a deterministic overhead-free machine with input alphabet Σ in polynomial time.

is the nondeterministic version of DOF,

Relationships among Overhead-Free Computation Classes

A Review of Linear Grammars

Definition

A grammar is linear if it is context-free and there is only one nonterminal per right-hand side.

Example

 $G_1 \colon S \to 00S0 \mid 1 \text{ and } G_2 \colon S \to 0S10 \mid 0.$

Definition

A grammar is deterministic if "there is always apply one rule t

"there is always only one rule that can be applied."

Example

 $G_1: S \rightarrow 00S0 \mid 1$ is deterministic.

 $G_2: S \to 0S10 \mid 0$ is **not** deterministic.

A Review of Linear Grammars

Definition

A grammar is linear if it is context-free and there is only one nonterminal per right-hand side.

Example

 $G_1: S \to 00S0 \mid 1 \text{ and } G_2: S \to 0S10 \mid 0.$

Definition

A grammar is deterministic if

"there is always only one rule that can be applied."

Example

 $G_1: S \rightarrow 00S0 \mid 1$ is deterministic.

 $G_2: S \to 0S10 \mid 0$ is **not** deterministic.

Deterministic Linear Languages Can Be Accepted in an Overhead-Free Way

Theorem

Every deterministic linear language is in DOF_{poly}.

Metalinear Languages Can Be Accepted in an Overhead-Free Way

Definition

A language is metalinear if it is the concatenation of linear languages.

Example

TRIPLE-PALINDROME = $\{uvw \mid u, v, \text{ and } w \text{ are palindromes}\}$.

$\mathsf{T}\mathsf{heorem}$

Every metalinear language is in NOF_{poly}.

Metalinear Languages Can Be Accepted in an Overhead-Free Way

Definition

A language is metalinear if it is the concatenation of linear languages.

Example

TRIPLE-PALINDROME = $\{uvw \mid u, v, \text{ and } w \text{ are palindromes}\}$.

Theorem

Every metalinear language is in NOF_{poly}.

Metalinear Languages Can Be Accepted in an Overhead-Free Way

Definition

A language is metalinear if it is the concatenation of linear languages.

Example

TRIPLE-PALINDROME = $\{uvw \mid u, v, \text{ and } w \text{ are palindromes}\}$.

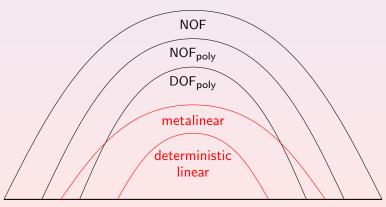

Theorem

Every metalinear language is in NOF_{poly}.

Relationships among Overhead-Free Computation Classes

Definition of Almost-Overhead-Free Computations

Definition

A Turing machine is almost-overhead-free if

- it has only a single tape,
- writes only on input cells,
- writes only symbols drawn from the input alphabet

Definition of Almost-Overhead-Free Computations

Definition

A Turing machine is almost-overhead-free if

- it has only a single tape,
- writes only on input cells,
- writes only symbols drawn from the input alphabet plus one special symbol.

Definition of Almost-Overhead-Free Computations

Definition

A Turing machine is almost-overhead-free if

- it has only a single tape,
- writes only on input cells,
- writes only symbols drawn from the input alphabet plus one special symbol.

Palindromes Linear Languages Forbidden Subword Complete Languages

Context-Free Languages with a Forbidden Subword Can Be Accepted in an Overhead-Free Way

Theorem

Let *L* be a context-free language with a forbidden word.

Then $L \in NOF_{poly}$.

Some Context-Sensitive Languages Cannot be Accepted in an Overhead-Free Way

Theorem

 $DOF \subseteq DLINSPACE$.

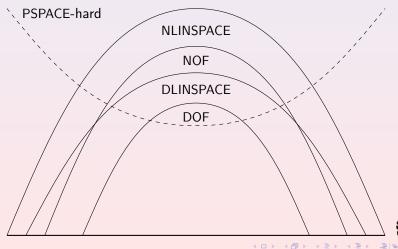

Theorem

 $NOF \subseteq NLINSPACE$.

The proofs are based on old diagonalisations due to Feldman, Owings, and Seiferas.

Relationships among Overhead-Free Computation Classes

Candidates for Languages that Cannot be Accepted in an Overhead-Free Way

Conjecture

DOUBLE-PALINDROMES ∉ DOF.

Conjecture

 $\{ww \mid w \in \{0,1\}^*\} \notin NOF.$

Proving the first conjecture would show DOF \subsetneq NOF.

Summary

- Overhead-free computation is a more faithful model of fixed-size memory.
- Overhead-free computation is less powerful than linear space.
- Many context-free languages can be accepted by overhead-free machines.
- We conjecture that all context-free languages are in NOF_{poly}.
- Our results can be seen as new results on the power of linear bounded automata with fixed alphabet size.

Appendix

Overhead Freeness and Completeness Improvements for Context-Free Languages Abbreviations

Overhead-Free Languages can be PSPACE-Complete

Theorem

DOF contains languages that are complete for PSPACE.

Proof.

- Let $A \in \mathsf{DLINSPACE}$ be PSPACE-complete. Such languages are known to exist.
- Let M be a linear space machine that accepts $A \subseteq \{0,1\}^*$ with tape alphabet Γ .
- Let $h: \Gamma \to \{0,1\}^*$ be an isometric, injective homomorphism.
- Then h(L) is in DOF and it is PSPACE-complete.

Improvements

Theorem

- 1. $DCFL \subseteq DOF_{poly}$.
- 2. $CFL \subseteq NOF_{poly}$.

Explanation of Different Abbreviations

DOF	Deterministic Overhead-Free.
NOF	Nondeterministic Overhead-Free.
DOF _{poly}	Deterministic Overhead-Free, polynomial time.
DOF _{poly}	Nondeterministic Overhead-Free, polynomial time.

Table: Explanation of what different abbreviations mean.
